

Simplified Checklist of Greek Lichens and Lichenicolous Fungi

The standard checklist is: Abbott, B. F. M. (2009). Checklist of the lichen and lichenicolous fungi of Greece. *Bibliotheca Lichenologica* 103: 1-368. It includes all reports known up to the time of publication, with full details of localities and synonymy. Incorrect reports and reports considered to be in need of confirmation are also noted. It also contains much other useful information. It is still in print, and serious students of Greek lichens are advised to obtain a copy.

The simplified checklist here shows only taxa considered to be known reliably from Greece. Most entries are based on published reports, but a very few are my own records that have not yet been formally published. To keep things simple, names are shown without authorship, except in cases where there might be ambiguity.

Non-lichenised, lichenicolous fungi are indicated with [LF]. Non-lichenised fungi that are not lichenicolous, but which are quite commonly studied by lichenologists, are indicated by [NL]. Some species of fungi are weakly lichenised or facultatively lichenised. Some other species are lichenised but have a very reduced thallus, so that their state is far from obvious. In other words, the distinction between lichenised and non-lichenised species is not sharp, and some of the designations here are debatable.
